

Bias in Fossil Interpretation?

It is interesting how evolutionist interpret fossils. The case of Rhodesian man is an example of how evolutionary bias colors the evidence.

The original journal article has been copied and is attached.

Rhodesian man is not 200-400k years old. The skull is not mineralized as would be expected if it were as old as claimed. All indications are that the skull is only a few hundred years old.

Cause of death may have been a gunshot wound.

Rhodesian man was in the company of several other individuals one of which has a very modern jaw. All the postcranial material, of all individuals is very modern looking. He may have been mining lead or zinc.
