

# The Formation of Fossils

The vast amount of fossils that are buried in the earth's strata is not proof of evolution but proof of a worldwide flood. A worldwide flood would destroy all land creatures and many marine organisms. This great upheaval would create large amounts of fossils. This is exactly what we find in the fossil record.

**Consider the fact that there are rock strata and fossils in the first place.**

- Today fossils are not being formed at the same accelerated rate as in the past.
- Sedimentary-layered rock strata are deposited by water.
- Fossils require quick burying and great pressure by overlying strata.
- Fossils are found in the same order they would be deposited.
- These facts prove a flood not a changing evolutionary order from simple to complex.

**According to scientist the strata can determine the age of fossils.**

- If the stratum was laid down in a short time the dating of fossils is not correct.
- This means that the evolutionary time scale is not correct.

**Fossils are proof of the destructive power of the Noachian Flood and God's Judgment.**
